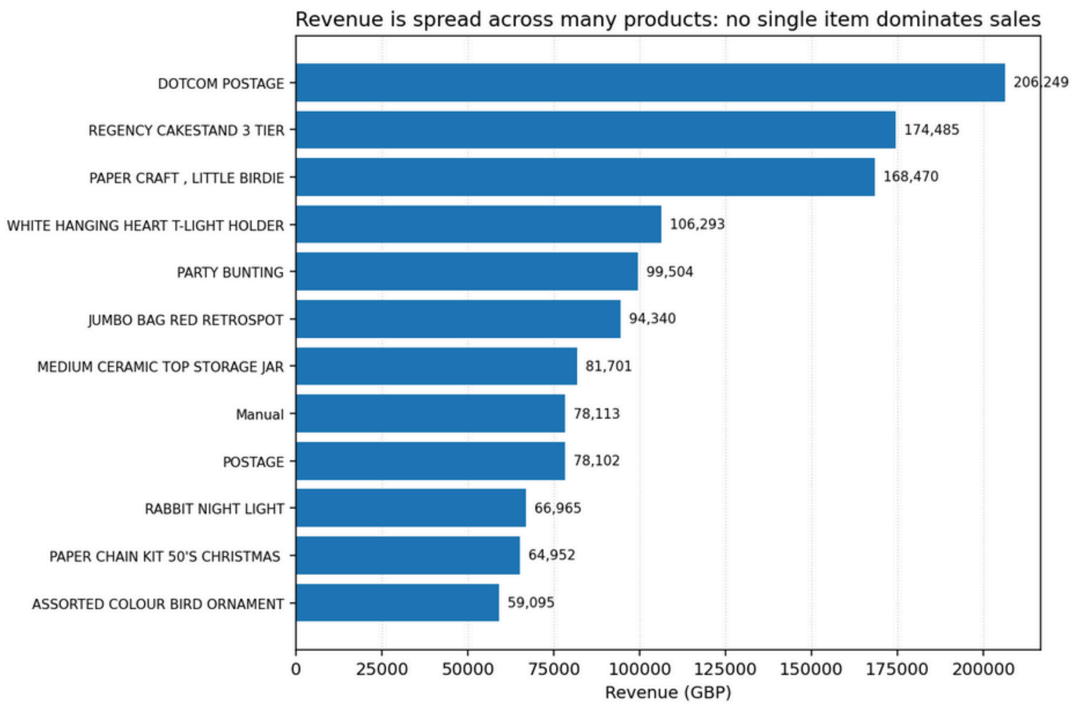
REVENUE IS SPREAD ACROSS MANY PRODUCTS:
NO SINGLE ITEM DOMINATES SALES

Question

Is the company's revenue driven by a small number of hero products, or is it spread across the catalog?



Finding

Revenue is not highly concentrated. The top 12 products together account for only about 12% of total revenue, and even the top 20 products represent less than a quarter of overall sales. The Pareto curve shows that many products are required to reach 80% of total revenue, indicating that sales are distributed across a long tail of products.

Why it matters

This means the business is not overly dependent on a few items, which reduces risk if any single product underperforms or goes out of stock. However, it also means that overall performance depends on maintaining a broad and healthy catalog rather than optimizing only a small set of bestsellers.

Action

Focus on improving product discovery (search, recommendations, and navigation) and monitor the long tail of low-volume products to ensure they remain profitable and do not create unnecessary operational cost.
